

Briefing TEST TASK (only billable if we will use it)

Create screen for the job list view of Outerscore based on Bootstrap/Material Design (and Angular?)

Expected result: A link to an HTML page where we should be able to judge if you can translate the current design more towards Ariba or Seerene (see videos next page)

Take the screenshot of the joblist as the basis and conduct the following changes:

1. Delete sidebar and move towards a horizontal design

Header similar to the following. Try if all menu items fit besides the search or center search and menu items below:

Active menu in Header:

An example for a horizontal design:

<https://wrappixel.com/demos/admin-templates/admin-pro/horizontal/index.html>

2. Adjust breadcrumb. Use for table header and next/back navi of table a standard from bootstrap e.g. <https://mdbootstrap.com/angular/components/>
3. Bring all buttons into an Ariba style design (no rounded buttons) e.g. using <https://mdbootstrap.com/angular/components/>

General design guidelines

The basis will be Material Design. A good example for a nice B2B design based on Material design is Seerene. But from the style we need to move a bit more towards Ariba, meaning e.g. field boxes instead of entry line like Material standard. However Material Design can be adjusted very easily using a Sketch plugin.

SEERENE:

Seerene has used Google Material Design

0:27min, 0:55 min, 1:13min, 1:36min, 1:56min
